

NutrioBox Dispatch — What We Changed Today & How It Helps

A plain-language summary of the fixes and new rules built on 19 Sep 2026: what was breaking, what the app and worker now do, and what the floor will see from tomorrow. Two parts run the dispatch — the gun (handheld) and the PACT worker (the server robot that posts vouchers into PACT).

1. The core problem we fixed

Items were showing **green / done on the gun but still pending in PACT** — they were never actually dispatched. We traced it to two real bugs and one design weakness:

- **Silent under-dispatch on the 2nd/3rd post.** The first auto-post created the voucher fine, but every later post tried to add to an already-posted voucher. The worker meant to open a fresh voucher for the extra items, but it stayed on the old posted one, clicked Post (which does nothing), and read the old “Posted” badge back as success. Those items were dropped but recorded as done. **Fixed.**
- **The gun trusted its own memory, not PACT.** “What’s already posted” was read from the device’s local ledger. If that ledger was ever wrong (which the bug above caused), the next cycle skipped items PACT still owed. **Fixed — every decision now comes from PACT.**

2. The rules the system now follows

Rule	What it does	Where
1. PACT is the truth	Every check — what’s owed, what’s delivered, what’s in stock — is read live from PACT, never from the gun’s memory.	Worker · LIVE
2. Smart error handling	On a PACT error the gun shows the EXACT reason and which item(s) for 10 seconds, then auto-retries leaving the flagged item(s) out so the rest still posts.	Gun + Worker
3. Batch-wise dispatch	For every batch: post = scanned – what PACT already delivered from that batch. Already-delivered batches are skipped automatically.	Worker · LIVE
4. 15-minute auto-post	Auto-post runs every 15 minutes (was 10).	Gun
5. 13-minute stock sync	Every 13 minutes the gun pulls fresh stock from PACT — so the post 2 minutes later uses up-to-date inventory.	Gun
6. Sync-then-post	The 13-min sync always lands ~2 minutes before the 15-min post, so each post is on the freshest stock.	Gun

3. How a dispatch runs now, start to finish

- The operator scans packs into the gun as usual (batch-level barcodes).
- Every **13 minutes** the gun refreshes that order’s stock from PACT.
- Every **15 minutes** the gun sends the scan to the worker. The worker asks PACT what’s already delivered **per batch**, and posts only the difference — nothing that PACT already has.
- If PACT flags an item, the gun shows the exact reason for **10 seconds**, then retries **without** that item; the rest posts. The flagged item keeps being shown until it’s fixed in PACT.
- On **Submit**, the same batch-wise logic posts everything still owed. PACT’s own per-line cap is the final backstop — it can never deliver more than the outlet ordered.

Why it’s safe to retry now: because every post is recalculated from PACT’s live delivered, a repeat can never double-dispatch — anything already delivered is simply skipped. This let us remove the old “pause and verify in PACT” step that used to stop the whole order.

4. What we changed today (technical)

Worker (server) — already live:

- Fixed the fresh-voucher bug so 2nd/3rd posts and Submit actually commit.
- Switched the “already delivered” source from the local ledger to PACT’s live pending report.

- Added **delivered-per-batch** capture from your updated “Pending Outlet Requisition Quantity” report, plus the product scale map, to post scanned – delivered per batch.
- Added exclusion of any product PACT hard-rejects, so one bad item never blocks the rest.
- Faster order sync (3 min) and a server timing config file (15 / 13 / 10) that can be tuned without touching the gun.

Gun app — build & flash v3.9.66 (delivered to your repo):

- Auto-post interval 10 → **15 minutes**.
- New **13-minute** per-order stock sync from PACT.
- New error behaviour: show the exact PACT reason + items for **10 seconds**, then auto-retry leaving the flagged items out (no more full stop).

5. What this gives you in daily dispatch from tomorrow

- **No more “green but pending”.** What the gun shows as done matches what PACT actually received — the under-dispatch that forced manual re-checks is gone.
- **Nothing gets dispatched twice, and nothing gets missed.** Every post is scanned-minus-delivered from PACT, per batch.
- **One bad item no longer stops the truck.** A mis-configured or out-of-stock item is left out with its exact reason shown; everything else still goes out on time.
- **Fewer manual interventions.** No more pausing to verify in PACT before resuming — the system self-corrects from PACT each cycle.
- **Fresher stock, cleaner posts.** The 13-minute sync means each 15-minute post runs on up-to-date inventory, so more lines land the first time.
- **Tunable without re-flashing the gun** (server timings) for future changes.

Action to go live: build the gun app (v3.9.66) in Android Studio and flash it over USB. The worker changes (Rules 1 and 3, error exclusion) are already running. — NutrioBox / Sukhna Foods dispatch, 19 Sep 2026.
