

NutrioBox Dispatch — Full Logic Detail: Before vs After

Every logical step in the dispatch pipeline, the exact logic used PREVIOUSLY, the logic in place AFTER today's changes (19 Sep 2026), and whether it was replaced, fixed, newly added, tuned, or unchanged. "Gun" = handheld app; "Worker" = the PACT posting robot on the server.

- REPLACED
- FIXED
- NEW
- TUNED
- UNCHANGED

PART A — What to post (the heart of the change)

1. Source of "what's already posted" (Gun + Worker)

REPLACED

PREVIOUS LOGIC	TODAY'S LOGIC
Read from the LOCAL LEDGER — the worker's voucher-map.json and the gun's in-memory postedPacks. The system trusted its own record of "what I posted," never asking PACT. If that record was ever wrong, later cycles skipped items PACT still owed.	Read LIVE from PACT every cycle: the "Pending Outlet Requisition Quantity" report (ordered / delivered / pending per product, now also per batch). The local ledger is demoted to a fallback used only when PACT has no snapshot yet — it can no longer cause an owed item to be skipped.

2. Delta calculation — how much to dispatch (Worker)

REPLACED

PREVIOUS LOGIC	TODAY'S LOGIC
delta = scanned – alreadyPosted(local ledger), per PRODUCT. A wrong ledger shrank the delta to ~0 and items stayed pending while showing green.	Two-step upgrade today: first to PACT product-level (skip products PACT shows delivered), then — using your updated report — to BATCH level: for each batch, post = scanned – PACT-delivered(that batch). Already-delivered batches are skipped; partially-delivered batches post only the remainder. The product-level version was itself replaced by the batch-level one.

3. Delivered-per-batch data + unit scale (Worker)

NEW

PREVIOUS LOGIC	TODAY'S LOGIC
Not available. The pending report was product-level only; the worker had no per-batch delivered figures and no product scale table, so batch-precise reconciliation was impossible.	Your report update added batch detail — the worker now captures delivered-per-batch on every sync. The product scale map (pack weight → units, 2169 products) was loaded onto the worker so scanned packs convert exactly to the report's units.

PART B — Posting the voucher

4. Voucher create vs append (Worker)

FIXED

PREVIOUS LOGIC	TODAY'S LOGIC
1st post CREATED the voucher; 2nd/3rd APPENDED to it. When the voucher was already posted, the code was meant to open a FRESH voucher for the extra items — but it stayed on the already-posted voucher, so the delta was never committed (the silent under-dispatch bug).	A fresh-draft guard forces a genuine blank Draft before scanning. With PACT-truth active, each cycle posts the owed items on a fresh voucher via the reliable create+post path, so the broken append-to-posted path is no longer relied on.

5. Post success detection (Worker)

FIXED

PREVIOUS LOGIC	TODAY'S LOGIC
Success = badge shows "Posted" OR grid empties OR Doc No advances. On a leftover already-posted voucher the badge was ALREADY "Posted," so the check returned a FALSE success and recorded a post that never happened.	The fresh-draft guard guarantees the baseline is a Draft with net 0, so "Posted" / "grid emptied" are only ever true after a real post. False-positive success is eliminated.

6. One bad item on a post (Gun + Worker)

NEW

PREVIOUS LOGIC	TODAY'S LOGIC
If PACT hard-rejected any single line (e.g. a mis-configured product, "not available in SO Dim"), it rejected the WHOLE voucher — every good item in that batch also failed — and the gun stopped.	The worker reads PACT's rejection, identifies the offending product from the flagged line, and EXCLUDES just that product on the retry, so all the other items still post. The excluded item keeps surfacing its exact reason until fixed.

7. PACT per-line cap (PACT)

UNCHANGED

PREVIOUS LOGIC	TODAY'S LOGIC
----------------	---------------

PACT caps every voucher line at that line's remaining pending quantity — it can never deliver more than the outlet ordered.	Unchanged — still the final backstop. Combined with PACT-truth, it means a repeat or over-scan can never over-dispatch.
---	---

PART C — Timing & error handling

8. Auto-post interval (Gun)		TUNED
PREVIOUS LOGIC	TODAY'S LOGIC	
Auto-post fired every 10 minutes.	Auto-post fires every 15 minutes (Rule 4).	
9. Stock / inventory sync (Gun + Worker)		NEW
PREVIOUS LOGIC	TODAY'S LOGIC	
Worker synced all inventory globally every 15 minutes; the gun refreshed the order's stock at the start of each auto-cycle. No dedicated per-order stock pull.	Added a 13-minute per-order stock sync on the gun, so fresh PACT stock always lands ~2 minutes before each 15-minute post (Rules 5 & 6). The global worker sync remains.	
10. Auto-post error behaviour (Gun)		REPLACED
PREVIOUS LOGIC	TODAY'S LOGIC	
On a rejection or an unconfirmed post, haltAuto STOPPED auto-posting entirely and showed a “verify the last voucher in PACT, then manually resume” dialog — the whole order paused until a person acted.	The gun shows the EXACT PACT reason and which item(s) for 10 seconds, then AUTOMATICALLY retries leaving the flagged item(s) out; the rest posts. The old “pause and verify in PACT” step was removed — safe now because every post recalculates from PACT, so a retry can never double-dispatch.	
11. Order (requisition) sync cadence (Worker)		TUNED
PREVIOUS LOGIC	TODAY'S LOGIC	
A single combined sync every ~30 minutes pulled orders and inventory together — new orders could take up to half an hour to appear.	Split earlier this session and still live: new orders sync every 3 minutes, inventory every 15. (Not changed again today; included for completeness.)	

PART D — Submit, completion & scan validations (carried into v3.9.66)

12. Final Submit (Gun + Worker)		REPLACED
PREVIOUS LOGIC	TODAY'S LOGIC	
Submit sent all remaining scanned items and marked the order completed, using the same local-ledger delta — so it could also under-dispatch.	Same Submit button, but the worker now reconciles it BATCH-wise from PACT (scanned – delivered per batch). No app change was needed — the worker handles it for every post, auto and manual.	
13. Completion / reopen reconciliation (Gun)		FIXED
PREVIOUS LOGIC	TODAY'S LOGIC	
An order marked completed on the gun stayed locked even if PACT still showed it pending — which is how orders got “stuck” completed but undelivered.	Added earlier this session and carried in the flash: if PACT still shows an order pending, the gun clears the stale “completed” lock automatically (both on the order and in the list), so it can be dispatched again. PACT is the source of truth for completion.	
14. Scan-time validations & caps (Gun)		UNCHANGED
PREVIOUS LOGIC	TODAY'S LOGIC	
Every scan checked: batch is in inventory, warehouse = dispatch warehouse, not expired, quantity ≤ pending; plus a race-safe per-batch cap and a product-total cap (built earlier this session).	Unchanged in logic — these validations and caps are carried into v3.9.66 as-is. (They validate against the gun's last synced stock; PACT's live checks at post time remain the final authority.)	

Legend: REPLACED = old logic swapped for new · FIXED = bug corrected · NEW = capability added · TUNED = value changed · UNCHANGED = kept. Worker items (1–7, 11, 12-worker) are already live; gun items land when v3.9.66 is flashed. — NutriBox / Sukhna Foods dispatch, 19 Sep 2026.
