

Dispatch Auto-Post — The “One Voucher Per Order” Issue

What is going wrong, why, whose it is, and how we fix it. Written for the NutrioBox / Sukhna Foods dispatch team. Based on live testing of order OMR-AF/26-27/2364 on 21 Sep 2026.

1. The issue in one line

When we dispatch a big order and want it all under ONE voucher number, the app keeps showing “Auto-post not confirmed — post uncertain” and retries, even though the items are actually being added to the voucher. So the dispatch looks stuck and the voucher / pending numbers look wrong on the gun.

2. How our dispatch is supposed to work (background)

- The gun operator scans an order. A background worker (on our server) posts those scans into PACT as a **Stock Outward** voucher.
- For big orders the operator does not scan everything in one go, so the app **auto-posts every few minutes** — it posts what has been scanned so far, then adds more later. This is on purpose: PACT cannot post a very large order in a single shot (it stalls / “order too big”).
- The rule we want: **one order = one voucher number**. The first auto-post creates the voucher; every later auto-post should ADD its new items onto that same voucher.

3. What actually happens (the error)

Adding items to a voucher that PACT has already POSTED does work — we proved it: a test item was added to voucher 2855 and it went from 21 lines to 22 lines, with the original lines untouched. And on order 2364 the delivered quantity on voucher 2854 climbed as items were added.

BUT: after adding items onto an already-posted voucher, **PACT does not give a clear “posted successfully” signal back**. On a fresh voucher, a successful post clears the screen to a new blank form — that is how the automation knows it worked. On an add-to-existing-voucher, PACT stays on the same screen and gives no clear confirmation. So the worker **cannot tell whether the add succeeded**, reports “post uncertain,” and retries again and again — which is the pop-up the operator sees.

4. Whose mistake is this?

It is fair to be clear about this, because it is nobody on the floor:

- **Not the operator**. The scanning and submitting are being done correctly.
- **Not a simple bug in our app logic**. The auto-post design, the one-voucher rule, and the safety checks that stop double-dispatch are all working as intended — and separate problems we found this week (duplicate pending rows, slow order sync) are already fixed.
- **The core limitation is in PACT (the ERP itself)**. Two PACT behaviours cause this: (a) PACT does not reliably confirm when you ADD items to an already-posted voucher, and (b) PACT is unreliable when asked to post a very large voucher in one go. Our automation has to work around both — it cannot change how PACT behaves.
- **One data problem is making it worse**: a product coded **FGO573** (shown as “Spinach Corn Kebab”, with a letter O instead of a zero) is malformed in the PACT catalogue and refuses to post — it needs to be corrected in PACT.

Short version: the auto-post idea is right and the item DOES get added — PACT just doesn’t send back a reliable “done” for an add-to-posted-voucher, so our system can’t trust it and keeps retrying. It is a PACT confirmation limitation, not an operator or floor error.

5. How it can be solved

Fix	What it does	Status
Verify each add by re-reading the voucher	After the worker adds items, it re-opens the voucher and checks the total actually went up — and only THEN marks it done. This replaces PACT’s missing confirmation with our own check, so the false “uncertain” and the endless retries stop, while staying on one voucher.	Recommended — to build

Fix	What it does	Status
Post in small chunks	Never post a big order in one shot; add a few items at a time. This avoids PACT's "too big" failure. (Already switched on.)	Done
Fix FGO573 in PACT	Correct or remove the malformed "Spinach Corn Kebab" (FGO573) product code so it stops blocking posts. Any single item that stays pending is left aside and the rest still posts.	PACT team to do
Fallback: reliable multi-voucher	If one-voucher ever cannot be made reliable, the safe alternative is to let a big order post as 2–3 vouchers — which always commits cleanly — rather than risk stuck dispatches.	Option

6. What is already fixed this week (so the team knows)

- **Pending quantity showing wrong (some 0, some full):** was caused by a duplicate copy of an order in the system — removed, and a safeguard added so it cannot recur.
- **New orders taking 10–15 minutes to reach the gun:** two stuck background jobs were silently blocking the sync — cleared, and a dedicated fast syncer now pulls new orders in about a minute.
- **Duplicate items across vouchers / re-posting:** the worker now reconciles against PACT's actual delivered quantities on every post, so **nothing is ever dispatched twice** even while this voucher issue is being sorted.

7. Current state of order 2364 (the test order)

Order 2364 is partly dispatched onto the single voucher AF/26-27/2854 (about 57 of 173 units at the time of writing) and is retrying the rest. It is a test order used to reproduce the problem; once the "verify each add" fix is in, an order like this will build up cleanly under one voucher without the retry pop-ups.
