

NutrioBox Dispatch — How the App, Server & PACT Connect

The whole pipeline on one page: how orders and stock come out of PACT into the gun, and how what the operator scans is fed back into PACT as Stock Outward vouchers.

DISPATCH goes INTO PACT → submit / auto-post puts a job in the queue; the worker logs into PACT and posts a Stock Outward voucher

a big order is posted in small batches, so it becomes several voucher numbers (PACT will not add to a voucher once it is posted)

LIVE STOCK also comes out of PACT the same way (inventory report → database → gun), so the gun always shows current batches & quantities.

Read it as a loop: PACT (5) is the master. The worker robot (4) reads PACT's reports and writes orders & stock into the database (3); the API (2) serves those to the gun (1). When the operator scans and submits, that flows back the other way — into the queue, and the worker posts it into PACT as Stock Outward vouchers. The blue path is data coming out of PACT; the red path is dispatch going back in.
