

Root-Cause Report — Order OMR-AF/26-27/2330 (Sector 63 Noida)

A full analysis of every cause behind the multi-voucher / pending-quantity errors seen on 21 Sep 2026, based on the actual server logs. Replaces the first note: this version includes the auto-post timing as a cause and the additional factors found on a deeper check.

1. What went wrong

- One order created **six vouchers** (AF/26-27/2846, 2847, 2849, 2850, 2852 ...) instead of one.
- The pending report kept **changing between reads** — items delivered in one refresh, pending in the next.
- Sweet Corn** was dispatched **30 against an order of 1**.

2. The timeline (from the server log)

Each auto-post fired about **5 minutes** apart. That timing is the key clue.

Time (IST)	Cycle	What the worker did	Result
10:24	1	Post 9 items	Voucher 2846 ✓
10:29	2	Refresh took ~2 min, then post 18 — “skipping 0 delivered”	FAILED (had the bad test product FGO573)
10:35	3	Post 20 (FGO573 excluded), “skipping 0” again	Voucher 2847 ✓
10:40	4	Post 1	Voucher 2849 ✓
10:43	5	Post 1	Voucher 2850 ✓
10:51	6	Post 6	Voucher 2852 ✓

“skipping 0 delivered” on every cycle is the smoking gun: the worker never saw the previous voucher’s deliveries, so it re-posted the same items into a new voucher each time.

3. All the causes (most important first)

#	Cause	What it did	Type
1	PACT report lag	PACT’s pending report takes several minutes to show a voucher’s deliveries. The worker relied on it to know “what’s already posted,” so it kept seeing “nothing delivered” and re-posted.	Core mechanism
2	5-minute auto-post timing (set Saturday)	The post fired faster than PACT’s report could catch up, so every cycle re-posted. At 15 minutes this would have had time to settle. THIS is the trigger you asked about — confirmed.	Trigger / amplifier
3	Slow “refresh-first” step	The pre-post PACT refresh itself took ~2 minutes, so a 5-minute cycle barely had 3 minutes of gap — tightening the squeeze further.	Compounding
4	FGO573 — the deliberately-broken test product — was in this order	It made cycle 2 FAIL outright; those items then got re-posted next cycle, adding to the voucher pile.	Contributing
5	One voucher per cycle (by design)	Auto-post creates a fresh voucher each cycle for new items; combined with the re-posting above, this multiplied the vouchers.	Design
6	Sweet Corn over-scan (old gun build)	The Sector 63 gun does not have the over-scan cap yet, so 30 were scanned for a 1 order and PACT accepted them. Unrelated to timing.	Separate error

4. What we have already fixed (live on the server)

- Report-lag bridge:** the worker now remembers exactly what it posted this session and will NOT re-send those packs while PACT’s report catches up. This removes causes #1, #2 and #3 as a source of duplicate vouchers — it is now safe at ANY timing, including 5 minutes.
- The bad-item exclusion (FGO573) and the batch-wise ‘post only what’s owed’ logic were already live and behaved correctly.

5. Still to be done

Action	Fixes which cause
Flash the new gun build (v3.9.69-test) onto the Sector 63 handheld	#6 — stops over-scans like Sweet Corn 30×1
Correct Sweet Corn in PACT for 2330 (30 → 1)	Cleans up the over-dispatch already recorded
Remove / fix the FGO573 test product in PACT	#4 — no more forced post failures
Consider running at 15-min / 13-min for daily use	Keeps voucher counts naturally low (on top of the fix)

6. A note on the diagnosis

The first summary named the report lag and the Sweet Corn over-scan but did not call out the 5-minute timing as a cause — you correctly raised it. On this deeper check the timing is confirmed as the trigger, and two more contributors (the slow refresh step and the FGO573 test product) were found. The server fix already deployed makes the system safe regardless of timing, so this specific failure will not repeat.
