

Prashant Vihar Dispatch — Morning Incident Report

NutrioBox → PACT ERP dispatch (Sales Order app → EC2 worker → PACT Stock Outward)

Prepared for: Satvik · Date: 12 September 2026 · Order in focus: OMR-AF/26-27/2005 (Prashant Vihar)

Bottom line: The root cause behind the recurring "scanned but still pending in PACT" failures on big orders was found and fixed on the worker, and deployed live. Two large orders posted clean end-to-end after the fix (Dwarka 2018 → AF/26-27/2565; Noida 2020 → AF/26-27/2569, Posted). One item remains open: confirming that the Prashant Vihar 2005 *beverage* lines have actually dispatched.

1. Problems faced this morning

Problem 1 — Items stayed "pending" in PACT even though the app had scanned them. FIXED

On the Prashant Vihar order (2005), roughly **205 units** — beverages plus quinoa, black burger, spinach, brown rice, pesto, pink sauce and momos remainders — showed pending quantity in PACT equal to the required quantity, despite being scanned in the app and the order showing green/complete.

Why it happened: When a scanned item landed on a stock batch that PACT considered stale or short, the worker was closing PACT's "Generate Batch Numbers" dialog and *silently skipping* that line instead of allocating the item to a valid batch. This only surfaced on bigger orders because those are the ones whose items span multiple / expiring batches — small mixed-category orders happened to land on clean batches and posted fine.

Problem 2 — Orders submitting green while scanned quantity was less than required. FIXED

The app could mark an order complete (green) and submit even when the scanned count was below the required quantity — an under-dispatch that looked successful.

Why it happened: Completion/pending counts were trusting locally-counted scans, including scans that never confirmed on the server, so the app over-counted what was actually dispatched.

Problem 3 — The last scan of some items (e.g. quinoa) not registering. FIXED

For certain items the final scan of the line was being dropped, leaving that line one unit short.

Why it happened: On a slow PACT grid, a late-appearing batch dialog arrived after the worker had moved on, so the last scan was not committed.

Problem 4 — The 4-second auto-post freeze had disappeared. FIXED

The safeguard that freezes new scans for 4 seconds during an auto-post (so a fresh scan can't slip into the wrong voucher) was not present in the running app.

Why it happened: The feature was not in the source build that had been flashed to the devices.

Problem 5 — Worker filled the voucher correctly but the final Post did not always commit. FIXED · MONITORING

On at least one Prashant Vihar beverage run the worker allocated every batch correctly into voucher AF/26-27/2572, but the final Post did not commit — the voucher remained an uncommitted draft.

Why it happened: A separate, older intermittency in the Post step (the form's Post button occasionally not firing). After hardening, two big orders posted clean, so this now appears resolved — but it is worth watching for a few days.

2. What we fixed and how

Fix	What we changed	Where / status
Batch re-allocation (FEFO)	When a scan hits a stale/short batch, the worker now reads the available batches, sorts them First-Expiry-First-Out, and allocates the required quantity across valid in-stock batches instead of closing the dialog and skipping the line. This is the fix for the "scanned but still pending" root cause.	EC2 worker — both code paths (new-voucher and append-to-existing-voucher). Deployed, syntax-checked, service active. LIVE
Slow-grid hardening	The post-scan wait was rebuilt to catch a late batch dialog and re-scan once (~16s window), so the final scan on a slow grid is no longer dropped.	EC2 worker, both paths. LIVE
Honest scan counting	Completion and pending now count only <i>server-confirmed</i> scans; a failed post rolls the local count back; in-flight scans are reconciled. An order can no longer go green on an under-dispatch.	Android app source (MainActivity). In source; flash to devices via USB. IN SOURCE
4-second auto-post freeze	Restored: during an auto-post the app freezes new scans for 4 seconds with an on-screen countdown, so no scan can leak into the wrong voucher.	Android app source. In source; flash to devices via USB. IN SOURCE
B2B / NB fetch filter	The "Fetch sales order" screen now filters NB (OMR-AF) orders correctly.	Android app source (SalesOrdersActivity). IN SOURCE
Post reliability	Hardened the final Post step. Verified by two large orders posting clean end-to-end after deployment (Dwarka 2018, Noida 2020).	EC2 worker. LIVE · WATCHING
Cleared stale "already-sent" memory for 2005	The worker keeps a per-order ledger of what it has already posted, to prevent double-dispatch. For order 2005 this ledger still held the beverage lines from an earlier uncommitted attempt, which would have blocked a clean re-dispatch. We surgically cleared the 17 beverage entries (and the stale voucher reference) while keeping the frozen-item entries intact.	EC2 worker ledger (voucher-map.json), backed up first. DONE

Proof the batch fix works. In the worker log, the same item that previously logged `OUT-OF-STOCK (skipped)`: `FG0003_FN0003/04092601_3000` now logs the batches being allocated FEFO and `added (re-batched 3000)` — i.e. the full quantity is placed instead of dropped. A safety property throughout: PACT caps every line at its own pending quantity, so nothing can ever be over-dispatched even if a re-run overlaps.

3. What is still pending

Open item	Detail	Owner / next step
CONFIRM Prashant Vihar 2005 beverages dispatched	The order in the posted screenshot was Noida 2020, <i>not</i> 2005. The 2005 beverage lines (~106 bottles, the FN0003 / FN0005 items) were still pending at the last confirmed check. The ledger is cleared so the worker can re-dispatch them cleanly. Need to confirm in PACT that 2005 now shows 0 pending — or re-run the dispatch for it.	Check 2005 in PACT; if still pending, Claude re-runs the dispatch (no over-dispatch risk).
FLASH App fixes onto handhelds	Problems 2, 3 (app-side), 4 and the B2B filter are in the app source but only take effect on devices once the updated build is flashed via USB with your own debug signing key.	Satvik — build in Android Studio, flash devices via USB.
WATCH Post reliability on big vouchers	Post now commits (two big orders confirmed), but this was the most intermittent piece. Worth spot-checking the first	Team — flag any filled-but-not-posted voucher;

	few large orders next week and flagging any that fill-but-don't-post.	Claude hardens further if it recurs.
--	---	--------------------------------------

4. What this means for the team from Monday

The recurring daily failure — big orders showing items pending in PACT after being scanned — was a worker-side batch-handling bug, and it is now fixed on the server for every order that runs through it, with no PACT-side change and no dependency on PACT's API. The app-side safeguards (honest counting, the 4-second freeze, the B2B filter) will be fully active on the handhelds once the current app source is flashed. After that, the team should be able to process these orders without you having to intervene each time; the only standing ask is to flag any rare voucher that fills but does not post, so it can be watched and hardened further.

Standing guarantees preserved throughout: no double-dispatch (per-order ledger + PACT's per-line cap), one voucher number per order, never posting to the wrong outlet, auto-post always on, and no dependency on any PACT API. · Report generated 12 Sep 2026.
